Answer the following 2 exercises in the way that you will do it for Aspose forum portal. We recommend be polite, neutral, and concise which the given response; provide code snippets if are required for the complete resolution of the query.

You can use the language of your preference, but we encourage the use of C#.

Push your response and the project used to test and validate your answers in a GitHub repository.

Tips:

1. Use the Aspose forum as reference before writing your answer.
2. Test the proposed solution first using the free trial of Aspose API.

Exercise 1

I have a Word document with multiple sections, and each section has different page numbers. For example, Section 1 has page numbers 1 to 4, and Section 2 has page numbers 6 to 9. How can I reset the page numbers for all sections in sequential order, I tried using the property RestartPageNumbering, but I still don't get the expected output?

(see attached Doc1.docx)

Exercise 2

While I'm reading the cell content using cell.getText().trim(), I'm losing the list context. Is there any library method which will return the cell content in the same list format. I need to create a new section for each row of the table using the content of the Col1 as title and appending the content of the rest of columns in the body of the corresponding section without losing format.

(see attached Doc2.docx)
